

Irrigation Audit

User Guide · v1.0

Irrigation Audit is a field-first app for auditing your maintenance properties on an iPad or iPhone, handing off to the estimating team, and sending a branded PDF report back to the property manager. Every property from your Monday.com board is already synced, so you can start an audit in two taps.

This guide walks you through everything: signing in, understanding a property, running an audit, the estimator handoff, generating the final report, and managing your org's settings.

Signing In

Go to irrigation-audit.takeo.co on any device — iPhone, iPad, or desktop. Enter your email address and tap **Send Magic Link**. Check your inbox, tap the link, and you're in. No passwords.

The link is good for 15 minutes and can only be used once. Your session stays active for a week after that, so you won't have to sign in again every day in the field.

TIP

On your iPad, add the site to your Home Screen (Safari → Share → Add to Home Screen) so it launches like a native app — no browser chrome, faster loading.

The Dashboard

The home screen shows every property on your Monday.com maintenance board. You can toggle between two views using the buttons in the top bar:

- **Grid view** — property cards with name, address, PM, last audit date, and status. Best for scanning a list and tapping into a specific property.
- **Map view** — all properties pinned on a Google Map. Tap a pin to see the address and jump into the property. Best for planning a day by geography.

The search bar filters by property name or address. The filter dropdowns narrow by PM, audit status, or sync source. The sort control re-orders by name, last audit date, or total audit count.

The Property Page

Tap any property card to open its page. This is the permanent record of what's installed on that site — controllers, water sources, backflow, zones, and parts. It's separate from any individual audit; think of it as the steady-state description of the irrigation system.

The property page is tabbed by system — most properties have one, but larger sites may have multiple (e.g., "Front Entrance" and "Back Amenity"). Each system has its own controllers, zones, and parts.

System Info

Top of the page. Shows the system name, controllers, water sources, backflow preventers, and any system-level notes. Tap **Edit** to update any of these fields.

Zones

The list of valves/zones for that system. Each zone entry tracks the zone number, name, head type, coverage area, and any parts assigned to it. You can edit a zone directly, re-order, or add a new one.

Parts

Materials installed on the system — heads, nozzles, valves, pipe, wire, etc. Parts can be system-level (e.g., the backflow assembly) or tied to a specific zone.

Files

Upload as-built drawings, worksheets, photos, emails, spec sheets — anything that documents the system. Files can be tagged system-level or attached to a specific zone. Use the **Archive to Drive** button to mirror a file into your Google Drive folder (handy for sharing with anyone not on the app).

NOTE

File storage is primary in the app — Drive is just a mirror. Disconnecting Google won't delete any files from the app itself.

Importing a System Automatically

Instead of typing out every zone and part by hand, you can let the app extract them from a document or photo. Two buttons live at the top of the property page:

Import from File

Upload an **.xlsx** takeoff or a **.pdf** as-built. Claude reads it, identifies the zones, and pulls out the parts with quantities. Review the extracted data, make any fixes, then confirm to save it to the property.

Import from Photo

Snap a photo of the zone chart glued inside the controller door. Upload it, and Claude reads the chart and creates the zones automatically — zone number, name, and area.

TIP

The zone-chart import is the fastest way to bootstrap a new property. Open the controller, take a picture, upload — you've got all the zones in about 30 seconds.

Running an Audit

An audit is a point-in-time inspection. Findings you log during an audit don't change the property profile — the profile is the description of what's installed; the audit is a snapshot of how it's working on a particular day.

Starting a New Audit

From a property page, tap **Start New Audit**. You'll be asked how to start it:

- **Blank** — empty audit. Useful for a property that's never been mapped out.
- **From last audit** — copies the zones and findings from the most recent audit. Fastest way to do a re-audit, since most of the structure carries over.
- **From system profile** — pre-populates zones from the property profile. Best for a first-ever audit on a property that you've already set up.

The Audit Hub

Once started, you land on the audit hub — a list of every zone with a progress indicator. You can work them in any order. A zone shows as complete when it has at least one finding (or an explicit "no issues" note).

Zone-by-Zone Findings

Tap a zone to open the finding entry screen. This is where you'll spend most of your time. It's built for the field — big buttons, minimal typing.

- **Quick-picks** — chips for the most common findings (broken head, tilted head, sunken, wrong nozzle, coverage gap, etc.). Tap one, confirm severity, done.
- **Custom wizard** — for anything not on the quick-pick list. Walks you through Category → Component → Size → Issue → Severity, each step narrowing the next.
- **Photos** — add a photo (or several) to any finding. iPhone photos get compressed automatically so uploads stay fast even on LTE.
- **Severity** — every finding needs a severity: Minor, Moderate, or Critical. This drives the priority the PM sees in the final report.

Finishing the Audit

When every zone is done, head back to the audit hub and tap **Finish Audit**. You'll see a summary screen with total findings by severity, per-zone breakdown, and photo count. From here you can export to Google Sheets (for the estimator) or generate the report (if pricing is already in).

HEADS UP

Don't leave a zone half-audited. If you truly found no issues in a zone, tap "No issues found" so it's recorded intentionally — a blank zone looks like an incomplete audit, not a clean one.

Estimator Handoff

Once an audit is finished, you can hand it off to the office by tapping **Export to Google Sheets** on the summary screen. The app creates a 4-tab spreadsheet in your configured Drive folder:

Tab	What's on it
Cover	Property, audit date, auditor, PM contact info
System	System-level info — controllers, water sources, backflow
Zones	Every zone with its parts and coverage notes
Findings	Every finding, ready for the estimator to price line-by-line

The estimator fills in unit prices and quantities directly in the sheet. When they're done, come back to the audit in the app and tap **Generate Report** — the app pulls the priced sheet and builds the final PDF.

Files Land Here

The export lives at: {Drive root} / Property Reports / {property name} / audit-{date} /. The root folder is whatever was picked during onboarding (or in Settings → Integrations → Google → Folder picker).

Generating the Final Report

From the audit summary (or the audit history on the property page), tap **Generate Report**. The app builds a branded PDF with:

- A cover page with your org's logo, colors, and the property/PM/date details.
- A system summary — controllers, water sources, backflow, high-level condition.
- Per-zone breakdown with findings, inline photos, and severity callouts.
- A parts list and pricing summary from the estimator's handoff sheet.

The report is saved on the property page under Files (tagged **report**) and is downloadable from there. You can also archive it to Google Drive with one tap for sending to the PM.

TIP

You can regenerate the report any time the data changes — e.g., if the estimator updates pricing. Each regeneration creates a new versioned file in Files; the old ones stick around in case you need to compare.

Settings

Your org's settings live under the avatar in the top-right corner. The main sections:

Section	What it does
Company	Org name, primary/secondary logos, brand colors, font. Or use Magic Fill: paste your website URL and the app pulls brand details automatically.
Monday	Monday API key + column mapping (address, PM, etc.). Sync pulls fresh properties from your board.
Google	OAuth connection + Drive folder picker. Controls where exports and reports land.
Config Sheet	The reference data for your audits — components, quick-picks, severity levels. Edit in Google Sheets, then Sync to apply.
Team	Invite teammates by email. Roles: admin, auditor, estimator.

FIRST TIME?

Fresh orgs get a 5-step onboarding wizard: Company → Monday → Branding → Google → Done. Finish it end-to-end once and you're ready for the field.

Tips from the Field

Work Offline-Friendly, Not Offline

The app isn't fully offline yet — but photos, findings, and zone notes all save quickly when you have a signal. If you're in a dead zone, just keep working — the next time your device reconnects, pending saves will push automatically.

Photos Compress Automatically

iPhone photos come out around 7–11 MB. The app squashes them down to under 1 MB before upload, so you can attach several photos per finding without slowing down the audit. Quality is preserved for the report.

Copy From Last Audit Saves 20 Minutes

On a recurring property, always start from last audit rather than blank. The zones carry over; you only have to log what's new or different. Most re-audits go twice as fast this way.

Use the Map View for Route Planning

In the morning, flip to map view, identify the 4–5 properties in the area, and batch them. The map view shows audit status at a glance so you know which ones need attention.

Troubleshooting

Symptom	Fix
Magic link didn't arrive	Check spam. If still nothing after 2 min, request another — the new one invalidates the old.
Photo won't upload	Usually signal-related. Keep the app open; it'll retry when back on Wi-Fi. HEIC photos from the iOS Files app may not compress — retake from the Camera app.
Monday property missing	Tap Settings → Monday → Sync. If it still doesn't appear, check your column mapping — the property may be missing its address column.
Report won't generate	The estimator sheet probably has missing prices on one or more findings. Open the sheet, check for blank unit-price cells, then try again.
Export to Sheets fails	Most often a Google re-auth issue. Settings → Integrations → Google → Reconnect. Your folder picker selection is preserved.
Brand colors look wrong	Settings → Company → Branding. Pick Primary and Secondary colors — the app auto-computes readable text colors for each.

Getting Help

Something not covered here, or something acting weird? Reach out to Takeo directly — send a quick note with a screenshot and what you were doing when it happened. The faster we see it, the faster it gets fixed.

Irrigation Audit is built and operated by Takeo (Takeoff Monkey). Production URL: irrigation-audit.takeo.co
